

# EcnLD, ECN Loss Differentiation to optimize the performance of transport protocols on wireless networks

Wassim Ramadan, Eugen Dedu and Julien Bouregois

Laboratoire d'Informatique de l'Université de Franche-Comté

Workshop on Mobile Computing and Networking Technologies  
14 October 2009

# Outline

- 1 Introduction
  - Objective
  - Why DCCP
- 2 Loss differentiation
- 3 Performance measurements
- 4 Conclusion

## Objective

- Improving performance of transport protocols over wireless networks
- Design a new transport protocol suitable for video streaming in wireless networks

## DCCP

- New protocol more adapted for multimedia transmissions :
  - Unreliable
  - Choice between two congestion controls
    - TFRC
    - **TCP-like**
  - Possibility to add its own congestion control
  - Mechanisms indicating to the sender with reliability which packets are received by the receiver
  - ECN utilization

# DCCP congestion control

## TCP-like

- Similar to the congestion control of TCP
- But :
  - Packet oriented
  - Selective Acknowledgement (SACK)
  - Well suited to multimedia data transport in environments where there are quick changes in network conditions

# Outline

- 1 Introduction
- 2 Loss differentiation
  - Motivation
  - ECN
  - Methods based on ECN
- 3 Performance measurements
- 4 Conclusion

## Cause of losses

- Congestion
- Interference, mobility, etc (in Wi-Fi)

Why we need to make a distinction between the two causes ?

- Avoid bad reaction when there is a loss
- Not to reduce rate to avoid congestion while it is an interference
  - Therefore : maximize throughput transmitted

Classification methods : Three Categories

- IAT, ROTT or **ECN (Our Approach EcnLD)**.

## Cause of losses

- Congestion
- Interference, mobility, etc (in Wi-Fi)

## Why we need to make a distinction between the two causes?

- Avoid bad reaction when there is a loss
- Not to reduce rate to avoid congestion while it is an interference
  - Therefore : maximize throughput transmitted

## Classification methods : Three Categories

- IAT, ROTT or **ECN (Our Approach EcnLD)**.

## Cause of losses

- Interference, mobility, etc (in Wi-Fi)

## Why we need to make a distinction between the two causes ?

- Avoid bad reaction when there is a loss
- Not to reduce rate to avoid congestion while it is an interference
  - Therefore : maximize throughput transmitted

## Classification methods : Three Categories

- IAT, ROTT or **ECN (Our Approach EcnLD)**.

# ECN (*Explicit Congestion Notification*)

## ECN principle

- Notify the sender without losing packets
- A packet ECN compatible is marked on a router before its queue becomes full, otherwise the packet is rejected

# EcnLD vs TCP-Eaglet

## TCP-Eaglet

- Algorithm : when there are one or more losses,
  - If (Slow Start) : halve transmission rate
  - Else (Congestion Avoidance) And ECN :
    - It is a congestion  $\Rightarrow$  halve transmission rate
- Problem : No differentiation in the slow start phase

## EcnLD, Our approach

- Use RTT in addition to ECN
- Algorithm : when there are one or more losses,
  - If ECN OR ( $n > 0$  AND  $RTT_{cur} > RTT_{ave} + RTT_{var}$ )  
Where :  $n$  is the number of losses returned in the acknowledgment
    - It is a congestion  $\Rightarrow$  halve transmission rate

# EcnLD vs TCP-Eaglet

## TCP-Eaglet

- Algorithm : when there are one or more losses,
  - If (Slow Start) : halve transmission rate
  - Else (Congestion Avoidance) And ECN :
    - It is a congestion  $\Rightarrow$  halve transmission rate
- Problem : No differentiation in the slow start phase

## EcnLD, Our approach

- Use RTT in addition to ECN
- Algorithm : when there are one or more losses,
  - If **ECN** OR ( $n > 0$  AND  $RTT_{cur} > RTT_{ave} + RTT_{var}$ )  
Where :  $n$  is the number of losses returned in the acknowledgment
    - It is a congestion  $\Rightarrow$  halve transmission rate

# Outline

- 1 Introduction
- 2 Loss differentiation
- 3 Performance measurements
  - Simulation topology
  - Simulation results
- 4 Conclusion

## Network used to perform simulations

The simulation time is 50 seconds. The sender is s1 and the receiver is m1

## Description of simulation

- Objective : compare the performance of **EcnLD**, TCPlike and TCP-Eaglet
- Two scenarios with an wireless error rate varying from 0% to 20%
  - Without competition
  - In competition with TCP (between s2 and d1. From 1 to 20s  
And from 25 to 45s)
- One or two MAC retransmissions

# EcnLD vs TCPlike

First scenario : without competition

## One retransmission

## Two retransmissions

## Results

Improved performance even with increased wireless error rate

# EcnLD vs TCPlike

First scenario : without competition

## One retransmission

## Two retransmissions

## Results

Improved performance even with increased wireless error rate

# EcnLD vs TCPlike

Second senario : in competition with TCP

## One retransmission

## Two retransmissions

## Results

Improving performance even in the presence of other traffic in the network

# EcnLD vs TCPlike

Second scenario : in competition with TCP

## One retransmission

## Two retransmissions

## Results

Improving performance even in the presence of other traffic in the network

# EcnLD vs TCP-Eaglet

First senario : in competition on a wireless network of 11Mb/s

## One retransmission

## Two retransmissions

## Results

Performances are nearly equal

# EcnLD vs TCP-Eaglet

First scenario : in competition on a wireless network of 11Mb/s

## One retransmission

## Two retransmissions

## Results

Performances are nearly equal

# EcnLD vs TCP-Eaglet

Second senario : in competition on a wireless network de 54Mb/s

## One retransmission

## Two retransmissions

## Results

EcnLD has a high ratio of received/sent packets

TCP-Eaglet has a higher throughput but loses a lot of packets on the network

# EcnLD vs TCP-Eaglet

Second senario : in competition on a wireless network de 54Mb/s

## One retransmission

## Two retransmissions

## Results

EcnLD has a high ratio of received/sent packets

TCP-Eaglet has a higher throughput but losses a lot of packets on the network

## EcnLD vs TCP-Eaglet : Loss classification percentage

| One retr. 11Mb/s | 0%   | 4%  | 8%  | 12% | 16% | 20% | Avg |
|------------------|------|-----|-----|-----|-----|-----|-----|
| EcnLD            | 100% | 79% | 68% | 68% | 67% | 69% | 72% |
| Eaglet           | 100% | 84% | 86% | 90% | 89% | 88% | 86% |
| Two retr.        | 0%   | 4%  | 8%  | 12% | 16% | 20% | Avg |
| EcnLD            | 100% | 76% | 63% | 51% | 72% | 81% | 73% |
| Eaglet           | 100% | 50% | 50% | 79% | 51% | 54% | 64% |

| One retr. 54Mb/s | 0%  | 4%  | 8%  | 12% | 16% | 20% | Avg |
|------------------|-----|-----|-----|-----|-----|-----|-----|
| EcnLD            | 40% | 53% | 64% | 75% | 73% | 72% | 64% |
| Eaglet           | 4%  | 4%  | 10% | 26% | 33% | 41% | 18% |
| Two retr.        | 0%  | 4%  | 8%  | 12% | 16% | 20% | Avg |
| EcnLD            | 41% | 34% | 25% | 66% | 48% | 53% | 43% |
| Eaglet           | 3%  | 2%  | 2%  | 9%  | 10% | 16% | 6%  |

### Results

EcnLD has a higher loss classification rate in most cases

TCP-Eaglet bad classification results in a higher throughput but less network friendly

## EcnLD vs TCP-Eaglet : Loss classification percentage

| One retr. 11Mb/s | 0%   | 4%  | 8%  | 12% | 16% | 20% | Avg |

| EcnLD            | 100% | 79% | 68% | 68% | 67% | 69% | 72% |
| Eaglet           | 100% | 84% | 86% | 90% | 89% | 88% | 86% |
| Two retr.        | 0%   | 4%  | 8%  | 12% | 16% | 20% | Avg |
| EcnLD            | 100% | 76% | 63% | 51% | 72% | 81% | 73% |
| Eaglet           | 100% | 50% | 50% | 79% | 51% | 54% | 64% |

| One retr. 54Mb/s | 0%  | 4%  | 8%  | 12% | 16% | 20% | Avg |
|------------------|-----|-----|-----|-----|-----|-----|-----|
| EcnLD            | 40% | 53% | 64% | 75% | 73% | 72% | 64% |
| Eaglet           | 4%  | 4%  | 10% | 26% | 33% | 41% | 18% |
| Two retr.        | 0%  | 4%  | 8%  | 12% | 16% | 20% | Avg |
| EcnLD            | 41% | 34% | 25% | 66% | 48% | 53% | 43% |
| Eaglet           | 3%  | 2%  | 2%  | 9%  | 10% | 16% | 6%  |

### Results

EcnLD has a higher loss classification rate in most cases

TCP-Eaglet bad classification results in a higher throughput but less network friendly

# Outline

- 1 Introduction
- 2 Loss differentiation
- 3 Performance measurements
- 4 Conclusion
  - Conclusion and perspectives

# Conclusion and perspectives

## Conclusion

- EcnLD has a very high rate of received packets, which designed to improve performance on wireless networks
- EcnLD carries a very high packets reception rate, which makes it suitable to streaming multimedia

## Perspectives

- Improving our contribution in wireless networks to design a new multi-radio protocol

# Conclusion and perspectives

## Conclusion

- EcnLD has a very high rate of received packets, which designed to improve performance on wireless networks
- EcnLD carries a very high packets reception rate, which makes it suitable to streaming multimedia

## Perspectives

- Improving our contribution in wireless networks to design a new multi-radio protocol
